

Water Tank Condition Assessment and Cleaning

Biofilm and inorganic residues can collect on the interior surfaces of potable water storage tanks and lead to taste and odor complaints, regulatory compliance issues and system function problems. Our experienced and specially trained field crews perform thorough water tank inspection services, cleanings and disinfections to keep water tanks in like-new condition, minimizing system downtime and maximizing water quality.

The challenge

Asset preservation

Pinpoint and address potential issues in a timely way.

Regulatory compliance

AWWA C652 recommends tank washout and inspection every three years.

Water quality

Biofilm growth can lead to odor and taste complaints. Inorganic residues can result in buildup of disinfectant byproducts (DBPs).

Condition assessments, washouts and chemical cleanings help maintain water quality and keep your municipal potable water tanks in compliance with all regulations.

Learn more on the back.

Washout, cleaning and disinfecting in accordance with AWWA C652

Regular conditions assessments, washouts and chemical cleanings should be part of the preventative maintenance of any water storage tank. They keep the tank in like-new condition, improving the return on your large capital investment while lowering related operation and maintenance costs.

A comprehensive approach

Tank Condition Assessment

We visually inspect the interior/exterior of the tank. We can use drones to safely inspect the exterior of elevated storage tanks and underwater remotely operated vehicles (ROVs) to inspect the interior of tanks that cannot be drained without disrupting water supply. If necessary our personnel can qualify the specific causes of organic and inorganic deposits through surface testing to recommend a targeted remediation solution.

Reporting and documentation

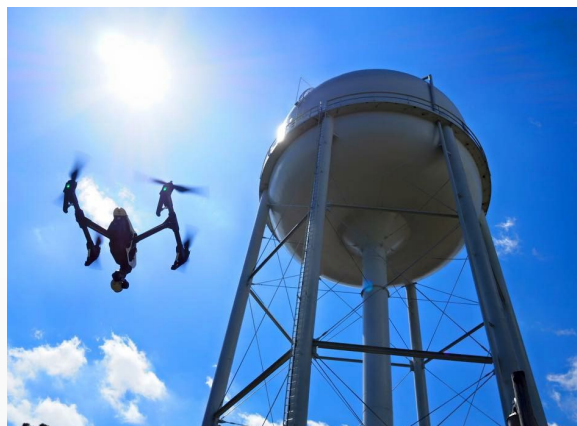

After each inspection, we provide a report of our findings to assure compliance with state regulations. Our Condition Assessment Report gives an overview of the safety, structural, sanitary, security and coatings conditions of the tank so no potential maintenance issue is overlooked.

Washouts and Chemical cleanings

Periodically draining and cleaning the inside of a tank eliminates mineral buildup and biofilm growth, and helps maintain a high level of water quality. We use patented NSF certified technologies for chemical cleanings and all washouts are performed in compliance with all applicable OSHA safety regulations including confined space.

The benefits

- ✓ Extend tank service life
- ✓ Improve water quality
- ✓ Facilitate regulatory compliance
- ✓ Reduce costs

The ultimate solution:

USG Water Solutions Asset Management

At USG Water Solutions, we believe you shouldn't have to choose between a capital expense that is beyond your budget and an unpredictable run-to-failure approach. Our Asset Management Program packages the rehabilitation and future maintenance of your assets into a single contract, with USG Water Solutions assuming all maintenance risk for a set annual cost.

Preserve water tank assets.
